

## Sidebar: Climate Control Timers and Remotes

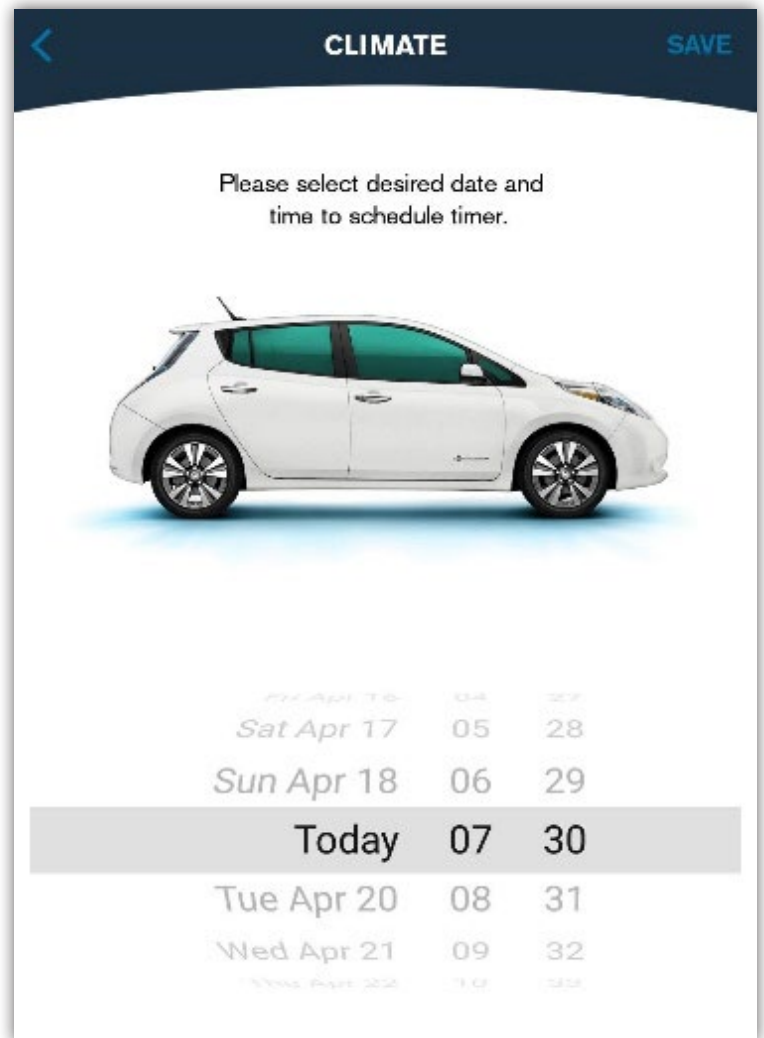

Did you know that you can start the climate control in most EVs remotely or set it on a timer? It's like a remote start, but you only turn on the heater or air conditioner. Best of all, you can do this while the car is still plugged in to warm up or cool down the cabin and not use the energy from your battery. That way you can start your trip fully charged.

Battery electric vehicles have no tail pipe, so no worries about starting the climate control in a closed garage. Most EVs will let you start the climate control from an app or key fob. Additionally, check your owner's manual to see if your car has a climate control timer.

So warm up or cool down your car while you're getting ready to head out and never get into an uncomfortably hot or cold vehicle again!

Set your climate control timer and get into a comfortable car

Start the climate control in your EV with an app or the key fob
